Why attend

Predictive maintenance uses condition data to repair equipment just before it fails. This course covers condition monitoring techniques such as vibration, thermography, oil analysis and ultrasound, setting alarm limits, data trending, integrating with maintenance planning, sensors and IoT, and building a predictive maintenance programme.

Time-based maintenance either fixes healthy equipment or misses failures. You will learn to maintain based on actual condition.

Professional Problems This Course Is Designed to Solve

• Difficulty translating subject knowledge into practical workplace decisions.
• Inconsistent approaches to the activities covered in the course outline.
• Lack of a structured plan for applying and reviewing new skills.

Course methodology

Technique demonstrations, data interpretation exercises, case studies and programme design.

Course objectives

By the end of this course, participants will be able to:
• Explain the P-F curve and predictive maintenance concepts
• Select condition monitoring techniques
• Set monitoring frequencies and alarm limits
• Interpret condition data and trends
• Integrate findings into maintenance planning
• Build a predictive maintenance programme
